Assessment Outline

- **Goal:** Measure learning outcomes of students upon completion of undergraduate statistics program (e.g. major)
 - snapshot of student learning outcomes;
 - facilitate cohort comparisons for program evaluation;
 - probe competencies exposed through extracurricular or peripheral experiences;
- Constraints
 - Align to (2014) ASA Curriculum Guidelines¹
 - Comprehensive scope
 - Easy to implement across institutions & years
- Outcomes
 - two assessment tools
 - multi-year pilot
 - good instrument reliability & strong item metrics

¹American Statistical Association Undergraduate Guidelines Workgroup (2014). 2014 Curriculum guidelines for undergraduate programs in statistical science. Alexandria, VA: American Statistical Association.

(2014) ASA Guidelines for Undergraduate Programs in Statistical Sciences

43 See Zhu et al. (2013)⁴³ "Data acquisition and pre-processing in studies on humans. What is not taught in statistics classes." *The American Statistician*, 67(6):235–241, which includes a series of skills: (1) get to know the study; (2) assess the validity of variable coding; (3) assess data entry accuracy; (4) perform data cleaning; and (5) edit identified data errors.

44 Although we acknowledge that Microsoft Excel is a common platform for data exchange, we do not recommend it as a primary analysis environment.

45 Appropriate environments could include R, Python, and SAS, complemented by tools including shell scripts and Jupyter.

46 Futschek (2006) defines algorithmic thinking as a set of abilities related to constructing and understanding algorithms: (1) the ability to analyze a given problem; (2) the ability to precisely specify a problem; (3) the ability to find the basic actions that are adequate to the given problem; (4) the ability to construct a correct algorithm to a given problem using basic actions; (5) the ability to think about all possible special and normal cases of a problem; and (6) the ability to improve the efficiency of an algorithm. Futschek, G. (2006). "Algorithmic thinking: The key for understanding computer science," in R. Mittermeier (Ed.), *Informatics Education—The Bridge Between Using and Understanding Computers* (Vol. 4226, pp. 159–168). Berlin/Heidelberg: Springer. We consider this to be a necessary, but not sufficient component of "computational thinking."

47 We define structured programming as the ability to use functions and control structures (e.g., "for" loops).

48 This recommendation is consistent with the efforts of Conrad Wolfram and the Computer-Based Math Initiative, www.computerbasedmath.org and www.k12math.org/ted-wolfram. The incorporation of these tools may be particularly valuable at the bachelor's level, since students will generally have less technical knowledge (and need to be able to simulate to generate insights and/or check analytic results).

49 Students should develop the capacity to manipulate formats such as CSV, JSON (JavaScript Object Notation, a data-interchange format that is easy to read, parse, and generate; see Nolan and Temple Lang (2014)), XML, and Web Technologies for Data Sciences with R, XML, databases (see, for example, Ripley (2001)). "Using databases with R," *R News*, 11(1):19–20 and Wickham (2011). "ASA 2009 Data Expert," *Journal of Computational and Graphical Statistics*, 20(2):281–283, and text data. Because many faculty were not trained in these technologies, continuing education in this area needs to be made a priority.

50 We are not prescriptive regarding which technologies are incorporated into the curriculum, as long as they are sufficiently flexible and powerful. Many undergraduate statistics students develop expertise in environments such as R/RStudio, Python, and SAS.

51 Multivariate calculus is recommended.

52 Markov chains are a useful topic for undergraduate majors in statistics.

53 This linkage includes topics such as the delta method. In addition, many students might benefit from exposure to modeling and simulation in their mathematics courses as a way to reinforce their computational skills.

data. Such skills underpin strategies for assessing and ensuring data quality as part of data preparation and are a necessary precursor to many analyses⁴³.

- Use of one or more professional statistical software environments⁴⁴
- Data management using software in a well-documented and reproducible way⁴⁵, data processing in different formats, and methods for addressing missing data
- Basic programming concepts (e.g., breaking a problem into modular pieces, algorithmic thinking⁴⁶, structured programming⁴⁷, debugging, and efficiency)
- Computationally intensive statistical methods (e.g., iterative methods, optimization, resampling, and simulation/Monte Carlo methods)⁴⁸
- Use of multiple data tools⁴⁹, so graduates are not wedded to one and are better able to learn new technologies⁵⁰

Mathematical Foundations

The study of mathematics lays the foundation for statistical theory. Undergraduate statistics majors should have a firm understanding of why and when statistical methods work. They should be able to communicate in the language of mathematics and explain the interplay between mathematical derivations and statistical applications.

- Calculus (e.g., integration and differentiation)⁵¹
- Linear algebra (e.g., matrix manipulations, linear transformations, projections in Euclidean space, eigenvalues/eigenvectors, and matrix decompositions)

- Probability (e.g., properties of univariate and multivariate random variables, discrete and continuous distributions)⁵²
- Emphasis on connections between concepts in these mathematical foundations courses and their applications in statistics⁵³

Statistical Practice

Strong communication skills complement technical knowledge and are particularly necessary for statisticians; graduates need technical skills to perform analyses and communication skills to understand clients' needs and then effectively discuss results and conclusions. Important practical skills include the following:

Comprehensive Undergraduate Statistics Program (CUSP) Assessment Strategy

- ASA Guidelines cite 95 competencies aligned to 6 major topics
- Single assessment tool unlikely to match breadth & depth

# Competencies	Topic area
37	Statistical Methods & Theory
16	Data Wrangling & Computing / Data Science
11	Mathematical Foundations
18	Statistical Practice
9	Problem Solving
4	Discipline-Specific Knowledge

Comprehensive Undergraduate Statistics Program (CUSP) Assessment

- Direct assessment
 - selected response test
 - approx. 1 hour duration
 - multiple institutions w. single cohort
 - single institution w. multiple cohorts
- Indirect assessment
 - survey data self-reported by students
 - approx. 10-15 minutes duration
 - several cohorts from single institution

CUSP Survey

- Inventory of 95 competencies cited in the ASA Guidelines
- What do **students** feel they know & don't know
- **Benefits**
 - Easy implementation
 - Can be administered multiple times if desired
 - No problem including topics we don't teach
 - Includes demographics
- **Risks/Issues**
 - Reliability of self-reporting
 - Over/Underconfidence with content exposure

Excerpt

Statistical Theory

(scale: [1] very low / never learned; [2] low; [3] fair; [4] good; [5] very good; [6] excellent; [7] exceptional)

Please rate your **current level of knowledge/competency** related to:

CUSP Test Design

- Selected response assessment tool with broad coverage
- 33 tasks; some with multiple parts
 - 9 testlets
 - 24 conventional MC questions
- several tasks/subtasks assess multiple competencies
 - diminishing weight attributed to successive competencies (1, 1/2, 1/4, ...)
 - 86 points possible
- Mix of original tasks & some from established instruments (used with permission)
 - 2 from the REGRESS assessment²
 - 9 from the CAOS assessment³

²Enders, F. (2013). Do clinical and translational science graduate students understand linear regression? Development and early validation of the REGRESS quiz. *Clinical and Translational Science*, 6(6). p. 444-451.

³delMas, R., Garfield, J., Ooms, A., Chance, B. (2007). Assessing students' conceptual understanding after a first course in statistics. *Statistics Education Research Journal*, 6. p. 28-58.

CUSP Test Excerpt (partial item)

driver or passenger side.

Study design dictates appropriate statistical analysis, but often there is more than one reasonable approach to the analysis. Evaluate whether each of the following analysis suggestions is VALID or NOT VALID for testing and estimating the difference in durability for the two brake pad materials:

	Valid	NOT Valid
paired t-test for brake pad difference of each car (DriverSide - PassengerSide)	<input type="radio"/>	<input type="radio"/>
paired t-test for brake pad difference of each car (Experimental - Standard)	<input type="radio"/>	<input type="radio"/>
ANOVA with car as a blocking variable	<input type="radio"/>	<input type="radio"/>

CUSP Test

- **Benefits**

- test statistical “reflexes” of students
- built-in “CAOS” subtest
- objective measure of student competencies
 - for individual students
 - for a class of students
 - aggregate useful for program evaluation
- Easy implementation

- **Risks/Issues**

- Scope constrained by test fatigue
- Includes topics we don't necessarily teach
- Longer to implement
- Variable use conditions may jeopardize comparisons

Preliminary Item Functioning Analysis

- Benchmarks for item statistics⁴
 - Unidimensionality assumed by most current methods in use for assessment evaluation
 - Cronbach alpha (reliability)
 - discrimination > 0.15 preferred
 - $0.6 < \text{proportion correct} < 0.9$
- Results
 - PCA evidence supports unidimensionality
 - Cronbach alpha = 0.81
 - 30/33 items with discrimination > 0.15
 - 9/33 items in recommended difficulty range
 - 21/33 items with $> 50\%$ correct

⁴Haladyna, T. M., & Rodriguez, M. C. (2013). *Developing and validating test items*. Routledge: New York.

Item discrimination

- Item discrimination < 0.15
 - (21% correct) Validity of models aligned to a study design
 - (3.6% correct) Strategies to maximize likelihood
 - (40% correct) CAOS task about CI interpretation
- Best item discrimination
 - (discrim = 0.59) Probability distributions task
 - (discrim = 0.50) Histograms & std deviation task
 - (discrim = 0.46) OLS regression assumptions task

Q20. Choose the **most** appropriate probability distribution from the list below for each of the scenarios described. Each distribution may be used more than once or not at all.

X = how many of the next 20 cars that pass you on the highway are silver colored.

Binomial

X = how much time until the next diet coke is purchased from a vending machine.

X = birth weights of infants born within one week of their due date at a given hospital.

X = the total number of goals scored during a randomly selected match in the FIFA World Cup soccer tournament.

✓
Bernoulli
Binomial
Continuous Uniform
Discrete Uniform
Exponential
Geometric
Normal

Future work

Shorter term goals

- Streamline logistics for wider implementation
- Link CUSP Survey data to CUSP Test outcomes
- Expand item bank

Longer term goals

- Experimentation with short/long forms
- Alternative or additional tools for more complete alignment to ASA Guidelines

CUSP Test: Student Summary Report

Report Generated: April 02, 2019

STUDENT DEMO (demo@psu.edu)

The Capstone Undergraduate Statistics Program (CUSP) Assessment measures learning outcomes of students in undergraduate statistics programs (e.g. majors) against the competencies cited in the 2014 ASA Guidelines for Undergraduate Programs in Statistical Sciences.¹ The 2014 ASA Guidelines are aligned to 6 major sections, with several subsections.

This assessment also included items from the Comprehensive Assessment of Outcomes in Statistics (CAOS) Test which includes topics accessible to introductory statistics students. CAOS tasks were selected assess common misconceptions that persist even among advanced undergraduate statistics students.

Additional remarks about scoring

Multiple choice items were scored with 2 points possible; multiple select items (i.e. "valid" or "NOT valid") were scored 1 point for each statement/decision task. Items pertinent to more than one competency of the 2014 ASA Guidelines were applied accordingly with diminishing weight credited to secondary or tertiary competencies (e.g. 100%, 50%, 25%). Consequently, some items inform more than one competency aligned to the 2014 ASA Guidelines. This assessment seeks to expose variability among students (like a standardized test) and not to certify achievement against a fixed competency standard (like a driver's license test), so scores near 50% are typical.

CUSP Test Blueprint

By design, some sections of the 2014 ASA Guidelines were given more or less weight than others in the CUSP Test. The development team established the following weights based on (1) priority in the curriculum and (2) feasibility for a selected-response assessment design.

Section	Subsection	Target Weight (%)
Statistical Methods and Theory	Statistical Theory	18.0
Statistical Methods and Theory	Exploratory Data Analysis	6.0
Statistical Methods and Theory	Design of Studies	18.0
